

AI Impact on Jobs

Workforce & Career Intelligence — Case Study

1. Business Problem

Artificial Intelligence is changing how different occupations may be performed. This project examines whether AI is more likely to automate tasks, augment workers, or have a disruptive or resistant impact across occupations.

2. Project Objective

The objective was to analyze AI-related job indicators and convert them into an interactive Power BI dashboard that helps users compare occupations and understand potential workforce impact.

3. Dataset & Analysis

The analysis covered 1,000 occupations. Excel PivotTables were used for analysis, followed by Power BI and DAX for the interactive report.

- AI Exposure — how strongly AI may affect an occupation.
- AI Adoption — the level of AI use associated with an occupation.
- Automation Potential — potential for AI to automate tasks.
- Augmentation Potential — potential for AI to assist and enhance workers.
- Employment Growth — an indicator of workforce trends.
- AI Impact Category — AI Augmented, AI Disrupted, or AI Resistant.

4. Key Metrics

- Total occupations: 1,000
- Average AI Exposure: 49.85
- Average AI Adoption: 34.06
- Average Automation Potential: 25.59
- Average Augmentation Potential: 40.94

5. Key Question

How can AI-related indicators be translated into a clear and useful view of workforce and career impact?

Dashboard 1 — Workforce Overview

Dashboard 2 — Career Impact Explorer

Insights & Conclusion

6. Dashboard Design

The report uses two interactive pages. The first provides a workforce-level overview, while the second acts as a Career Impact Explorer where users can select an occupation and view its AI-related indicators.

7. Key Insights

- AI exposure and AI adoption are different measures; high exposure does not automatically mean high current adoption.
- Augmentation potential (40.94) is higher than automation potential (25.59) in this dataset.
- AI impact varies across occupations, so occupation-level analysis adds useful context.
- The AI Impact Category groups occupations as AI Augmented, AI Disrupted, or AI Resistant.
- The dashboard moves from an overall workforce view to an individual occupation profile.

8. Business Value

The dashboard converts occupation-level data into a visual decision-support tool for exploring workforce trends, comparing occupations, and understanding AI-related career impact.

9. Tools Used

Excel • Power BI • DAX

10. Conclusion

This project demonstrates how data analysis and business intelligence tools can be used to study the relationship between AI and employment. Looking beyond automation to exposure, adoption, augmentation, and employment growth provides a broader view of potential occupational impact.

11. Skills Demonstrated

- Data analysis and interpretation
- Excel PivotTable analysis
- Power BI dashboard development
- DAX measures
- Data visualization
- Business insight generation
